

SQL Reports

SQL Reports Featured list Document Version 1.0

Overview :

This is a small tool which allows users to create SQL reports using queries entered directly from a web form. It also has a feature to manage Connections - they can be selected when creating a Report.

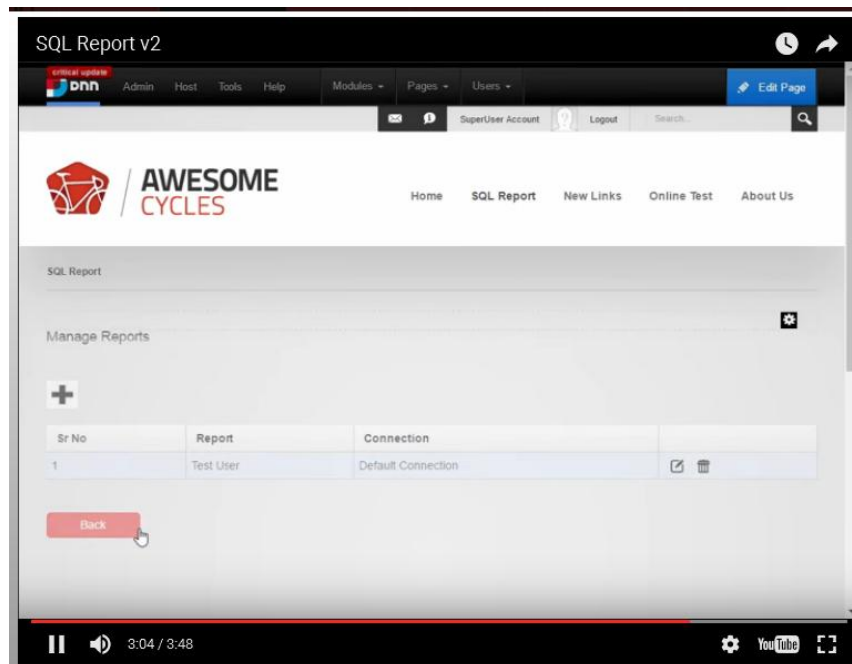

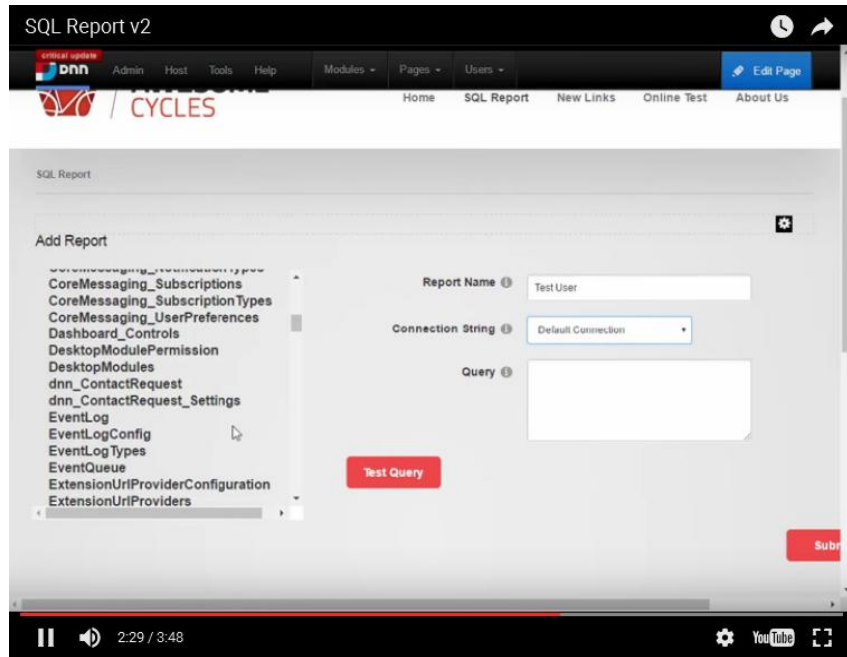

When a Report is to be viewed by a user, the Report will be generated using the configured Connection string. This gives users the ability to fetch reports from other applications and databases on a connected network.

Feature List :

1. User view reports in different Chart
 - The reports in this module can be viewed in 4 different patterns such as Grid view, Chart ,Column chart, Excel.
2. Users can add/edit reports and connection
 - The user can add a new connection by either auto generating the connect string or entering his own connection string.
 - The user can add or edit the added connection string and the reports as well
3. User can manage connection.
 - While adding the connection string the user can check the query that he entered is correct or no by clicking Test Query.
 - While testing the query the pages displays the database name and its table name including its column names.
4. User can manage reports
 - The excel reports can be extracted and displayed in charts depending on the type of data to be represented.
